Important todos for optimization

Technical problems

4 pages have duplicate page titles	Very important!
1 page/s could not be checked due to technical problems	Very important!
11 unretrievable file sources were found.	Very important!
There is no consistent redirect from the www. subdomain and your root domain without www	Very important!
1,364 pages have a medium response time between 0.5 and 1 second	Very important!
4 pages have a duplicate meta description	Very important!
1,786 pages have problems with H1 headings	Important!
Problems with headings were found on 1,243 pages	Important!
On 1 pages the alt attributes are missing for integrated images	Tip!
67 pages have a poor response time	Tip!

Sitestructure problems

2 pages compete with each other because of identical anchor texts.	Very important!
392 external links have problems	Important!
846 pages can only be reached with 3 or more clicks starting from the home page.	Tip!

Content problems

157 problem/problems were found with pages, that compete with each other due to keyword optimization	Very important!
On 1,966 pages some keywords from the H1 heading were not found in the page content	Important!
On 908 pages only some paragraphs were found	Tip!

Competing pages for the same keywords	157	-/-
Complete page duplicates	0	-/-

Pages with technical problems

Pages that could not be checked due to technical problems

Optimization Tips

Video tutorial included ►

The URLs in this list could not be retrieved by the Seobility crawler due to technical problems.

Why you should avoid technical issues:

Technical problems are not only frustrating for your visitors, but they can also cause search engines to miss potentially important content or to stop crawling your site. Avoid these errors at all costs to ensure that all of your important content can be crawled and [indexed](#) by search engines.

Most common error messages (in the column "Problem"):

- Request failed: The Seobility crawler could not reach the server when requesting this URL. Common causes: server performance issues, Seobility bot is blocked from accessing the page.
- Timeout: Your web server was reached but failed to respond within 10 seconds. Common cause: server performance issues.
- HTTP status: When the page was requested, the server sent an error code in response. For an overview of the meaning and causes of various HTTP status codes, [click here](#).
- Filesize too big: The page could not be retrieved because the HTML file is too large (more than 5MB).
- Invalid HTML: The page could not be crawled because the HTML code contains serious errors.
- Bot error (unknown): The page could not be retrieved due to an unknown error. Common cause: JavaScript crawling issues.

Here's how to fix the most common problems:

A common cause of technical problems is **poor server performance**. This can lead to error messages such as "Request failed" and "Timeout" and often occurs in combination with long response times (see the "Distribution of response times" analysis in the Tech & Meta section). You can find [tips for improving server response times here](#).

Another common cause is that the **Seobility bot is blocked from accessing your site**, which can lead to error messages such as "Request failed" or "HTTP status 403". In these cases, make sure that the Seobility bot is allowed to access your site. A list of user agents and Seobility IP addresses is available [here](#).

In case of 404 errors: correct or remove all internal links pointing to the broken URL. You can find these links by clicking on the URL in the list and then checking the "Links" tab. If the 404 error is caused by URL changes, you should also set up a 301 [redirect](#) from the old to the new URL.

Why does Seobility find these pages?

In general, a page can appear here for three reasons:

- There are internal links on your site pointing to the URL.
- The URL is ranking on Google.
- The URL has [backlinks](#) from external sites.

To find out how Seobility discovered the URL, click on the URL and check the "Links", "Backlinks" and "Rankings" tabs.

#	URL	Status code	Problem
1.	https://perfoumer.az/perfumes/narciso=eau-neroli-ambree	404	HTTP status code

Pages with problematic page titles

Problematic pages or page titles that require optimization

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the page titles on your website.

Why page titles are important for SEO:

The title of a web page (also known as the **"meta title"** or **"title tag"**) is one of the most important elements for on-page search engine optimisation. Search engines such as Google analyse the title to understand the content of a page and use the information it contains for ranking purposes. In addition, the title is displayed as the most prominent element in search results and should encourage searchers to click on the "search snippet". If the title tag is missing on a page, or if the title does not meet Google's requirements, Google may generate its own title for the search results, which may lead to less ideal results.

What the notes in the "Problems" column mean:

- **Empty:** The title tag for this page contains no content.
- **Missing:** No title tag was found for this page.
- **Too short:** The page title is very short, wasting valuable optimization potential.
- **Only one word:** The page title consists of only 1 word, wasting valuable optimization potential.
- **Too long:** The page title is very long and is likely to be truncated in the search results.
- **Meaningless word:** The title gives no information about the content of the page.
- **Domain within the title:** The title contains only the domain name and gives no information about the content of the page.
- **Word repetition:** The title contains repeated words and could be interpreted as [keyword stuffing](#).

How to optimize your page titles:

- Length of 55 to 65 characters.
- Important keywords for the page should be used in the title.
- 2 to 3 keywords should be used in a logical context.
- The most important keywords should be located at the beginning of the title.
- The title of a page should not change too frequently.
- Each title should only appear once on the whole website.

You can find more optimization tips and information [in our wiki](#).

Tip: Use [Seobility's SERP snippet generator](#) to easily optimize the length of your page titles.

Duplicate page titles

Page titles that are used on several pages

Optimization Tips

This is a list of page titles used for more than one page on your website.

Why each page of your website should have a unique page title:

The title of a web page (also known as the "[meta title](#)" or "title tag") is one of the most important elements for on-page SEO. Search engines such as Google analyze the title to understand the content of a page and use the information it contains for ranking purposes.

Therefore, the title should reflect the page content as accurately as possible and be unique for each page. If you are using the same page title for a number of pages, it is likely that the title is not informative enough, or that it does not match the content of each page. This means that you are giving away valuable optimization potential, as all these pages will inevitably be optimized for the same keywords due to the identical title. With a unique title, they may have the potential to rank for other, more differentiated keywords that better match the content of each page.

Common reasons for duplicate page titles:

- Duplicate pages ([duplicate content](#))
- A page is accessible from multiple URLs and has no [canonical link](#) to the original page (e.g. pages with [parameters](#) in the URL).
- You are using a standard title for a number of sub-pages.
- You describe several pages with the same title, such as the home page and your company description.

How to fix these issues:

If the duplicate page title is due to duplicate content, you need to find out how this is caused. In many cases, you will be able to fix the problem by adding a [canonical tag](#) to the duplicate pages. See the duplicate content analyses in the "Content" section for more information.

In all other cases, you will need to define a unique page title for each of the URLs in question. You can find tips on how to optimize your page titles [in our wiki](#).

How to edit the page title in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)

#	Title	Affected URLs
1.	Bois Imperial - Essential Parfums Perfoumer	https://perfoumer.az/perfumes/bois-imperial https://perfoumer.az/perfumes/bois-imprial
2.	Cœur Battant - Louis Vuitton Perfoumer	https://perfoumer.az/perfumes/cur-battant https://perfoumer.az/perfumes/coeur-battant

Duplicate meta descriptions

Meta descriptions that are used on several pages

Optimization Tips

This is an overview of [meta descriptions](#) that are used for multiple pages of your website.

Why each relevant page should have a unique meta description:

Although a page's meta description doesn't directly affect the ranking of the page, it's an important element for SEO because it's displayed in the search results snippet in the [SERPs](#). It should encourage searchers to click on your snippet as it is the first contact they have with your website. For this reason, you should provide a description for each relevant page that is as precise as possible and that matches the content of the page.

Common reasons for duplicate meta descriptions:

- Duplicate pages ([duplicate content](#))
- A page is accessible from multiple URLs and has no [canonical link](#) to the original page (e.g. pages with [parameters](#) in the URL).
- You are using a standard description for several pages.

How to fix these problems:

If the duplicate meta descriptions are caused by duplicate content, you should find out how this is created. In many cases, you will be able to fix the problem by adding a [canonical tag](#) to the duplicate pages. For more information, see the duplicate content analyses in the "Content" section.

In all other cases, you should write a unique meta description for each affected URL. On our blog, we explain [how to write the perfect SEO meta description](#) step-by-step.

If your site is very large and it would be too time-consuming to create a good and unique description for each page, you can work with templates for less important pages. [Our blog post](#) explains how to do this as well.

How to edit the meta description in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)
- [Instructions for Squarespace](#)

#	Meta description	URLs concerned
1.	Essential Parfums Bois Imperial ətiri: Unisex üçün notlar, ölçülər və qiymətlər.	https://perfoumer.az/perfumes/bois-imperial https://perfoumer.az/perfumes/bois-imprial
2.	Louis Vuitton Cœur Battant ətiri: Qadın üçün notlar, ölçülər və qiymətlər.	https://perfoumer.az/perfumes/cur-battant https://perfoumer.az/perfumes/coeur-battant

Problems with meta descriptions

Missing or bad meta descriptions.

No errors or problems were found.

Problems with H1 headings

Problematic H1 headings

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with the H1 headings on your website.

Why H1 headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from H1 to H6. The H1 heading is the most important heading and should summarize the entire content of a page. It should be as specific and informative as possible, and include the most important keywords.

What the notes in the "Problems" column mean:

- **Missing:** No H1 heading was found on the page.
- **Empty:** The H1 tag contains no content.
- **Too short:** The content of the H1 tag is very short (e.g. two very short words) and may not be informative enough.
- **Only one word:** The H1 tag contains only one word and may not be informative enough.
- **Too long:** The content of the H1 tag is very long (more than 120 characters). Keep your headings as short and clear as possible.
- **Unimportant words:** The content of the H1 tag is very general (e.g. "Welcome") and does not provide information about the specific content of the page.
- **Too many:** The page contains more than one H1 heading, indicating that the structure needs improvement. Ideally, only one H1 should be used.

How to use H1 headings correctly:

- Only one H1 heading should be used on each page. Although Google is capable of handling multiple H1 headings, we recommend that you implement a clear hierarchical heading structure with a single main heading. This will keep the page clear for your visitors too.
- The heading in the H1 tag should match the page content and contain relevant keywords.
- The H1 heading should summarise the content of the page concisely and should not be too long.
- In general, headings should only be used to structure content and not for navigation elements, links, etc.

For more tips and information on optimizing your H1 headings, [see our wiki](#).

#	URL	Problems	H1 heading
1.	https://perfoumer.az/compare	Too short	Ətir Müqayisə 13 / 120 Characters

Problems with headings

Pages with problematic headings or problems within the heading structure

Optimization Tips

Video tutorial included ►

This analysis provides an overview of pages where Seobility detected problems with headings.

Why headings are important for SEO:

Headings are used to structure the body text on a website, making it easier for visitors to navigate. In addition, headings provide an overview of the page content and are also used by search engines

when analyzing the page content.

Generally, there is a hierarchical structure of headings from [H1 to H6](#), which can be compared to the hierarchy of headings in a regular text document. You should follow this hierarchy as far as possible to make your pages clearer for both search engines and visitors.

What the notes in the "Problems" column mean:

- **Empty heading:** The page contains empty heading tags.
- **Structural problem:** There is an error in the heading hierarchy, such as gaps in the hierarchy (e.g. H1 > H2 > H4) or errors in the order (e.g. H1 > H3 > H2).
- **Duplicate heading:** The page contains multiple headings with the same content.
- **Missing:** No headings were found on the page. You should add headings to structure the content.
- **Too many headings:** The page contains many heading tags. Check that their number is appropriate to the amount of text.

Click "Details" for more information about which specific headings on a page are affected by a problem.

How to use headings correctly:

- Headings should always be informative and reflect the content of the following section of text. Ideally, they should also contain important keywords.
- The number of headings should be reasonable in relation to the amount of text.
- To structure a paragraph more granularly, always use the next lower hierarchy level without jumps (after H1 comes H2, etc.).
- Headings should be neither too short nor too long.
- Use headings only to structure content and not for navigation elements, links or surrounding layout (e.g. contact forms, widgets, etc.). When in doubt, ask yourself if the heading you are using is related to the content of the page. If not, do not format it as a heading.

You can find more tips and information on how to optimize your headings [in our wiki](#).

Images with missing alt attributes

Pages with at least one missing alt attribute for an image

Optimization Tips

Video tutorial included ►

This list contains pages that have images with missing [ALT attributes](#).

Why ALT attributes are important for SEO:

Image ALT attributes are alternative image descriptions that browsers should display to visitors when an image fails to load. For search engines, these descriptions provide valuable information about the content of an image. This allows them to get a better understanding of the image content and associate it with a keyword or a subject area.

You can find more information about ALT attributes [in our wiki](#).

How to fix missing ALT attributes:

The pages in this list have been found to have either

- a missing ALT attribute, or
- an empty ALT attribute.

Click on "Details" next to the URL to find out which image files are affected.

Then, add an alternative description for each of these images on your website that accurately describes the image content.

You can find more tips on how to optimize your images for search engines in our [wiki article "Image SEO"](#).

How to add ALT attributes to images in the most popular content management systems:

- [Instructions for WordPress](#)
- [Instructions for Shopify](#)
- [Instructions for Wix](#)
- [Instructions for Squarespace](#)

Pages with big file size

HTML pages exceeding a file size of 0.5 MB

Optimization Tips

This is a list of pages that are very large (more than 0.5MB).

The pages with a file size of more than 5 MB have not been further analyzed by Seobility.

Why you should keep your HTML pages as small as possible:

The larger the file size of an HTML page, the longer the page will take to load in the browser. This can have a very negative impact on the user experience, especially on mobile devices. What's more, page loading time (also known as [page speed](#)) is an officially confirmed Google ranking factor, directly affecting your position in search results.

Common causes of very large HTML pages:

- Excessive use of inline CSS or [JavaScript](#).
- Embedding [SVG](#) images directly in the HTML code.

How to fix these problems:

First, check what is causing the large amount of HTML code. See if it can be reduced. Possible actions to take could be:

- Move excessive CSS and JavaScript into separate CSS and JavaScript files linked in the HTML code.
- Upload large SVG images to your server as separate files, and link to them in the HTML code.
- Turn off unnecessary features of your [CMS](#) / template that generate excessive code.
- Use compression such as [gzip](#).

#	URL	Filesize

Problems with strong and bold tags

Check of strong and bold tags finding too short, too long and duplicate tags.

No errors or problems were found.

Pages with frames

Pages with embedded framesets and IFrames

No errors or problems were found.

Pages that contain error reporting

Software error messages that are shown on the web page that should be avoided

No errors or problems were found.

URL parameters

Relevant pages with dynamic parameters in their URL.

No errors or problems were found.

Session ID in URL

Pages with session IDs in their URL.

No errors or problems were found.

Too many subdirectories

Pages with too many subdirectories in their URL.

No errors or problems were found.

URL too long

Pages with too long URLs

No errors or problems were found.

Non-retrievable file sources

Used files that were not retrieved in detail due to redirections and problems

Optimization Tips

Video tutorial included ►

This analysis gives you an overview of embedded files on your website (e.g. images, CSS and JavaScript files) that could not be retrieved from the server.

Why you should avoid unretrievable embedded files:

If embedded files can not be retrieved, this can have a serious impact on the [user experience](#) of your website. Nobody likes to browse a site where images won't load or the layout doesn't display correctly due to missing CSS files.

It is also important for Google to be able to access all of the relevant files so that the content of your pages can be fully and correctly [indexed](#).

What the messages in the "Error" column mean:

- **Request failed:** When requesting this file, the Seobility crawler was unable to reach the server. You can get more information about the cause from the HTTP status code next to it (if available). You can find an overview of the meaning of different HTTP status codes [here](#).
- **Timeout:** The server was reached when the file was requested. However, it did not send a response within 10 seconds. Common cause: server performance issues.
- **SSL/TLS error:** A problem has occurred during the [SSL/TLS handshake](#).
- **Invalid URL scheme:** The URL of the embedded file is incorrect.
- **Bot error (unknown):** An unknown problem occurred while retrieving the file.

How to fix the most common problems:

A common cause of unretrievable files is **poor server performance**. This can lead to error messages such as "Request failed" or "Timeout". These errors often occur in combination with long page response times (see the "distribution of response times" analysis in the Tech. & Meta section). You can find [tips for improving your server response times here](#).

Another common cause is that the **Seobility Bot is blocked from accessing the files**. This can lead to error messages such as "Request failed" or an HTTP status 403. In these cases, you need to make sure that the Seobility Bot is allowed to access your website. You can find an overview of [Seobility's user agent and IP addresses here](#).

In the case of 404 errors and invalid URLs: correct or remove internal links that point to the wrong file URL (which cannot be retrieved). You can find these links by clicking on the URL in the list. This will allow you to see all the pages that contain the file in question.

Issues with file sources

Used files that have problems

Optimization Tips

Video tutorial included ►

This analysis will show you if there are problems with embedded files on your website.

Why you should avoid problems with files on your website:

Files that are needed to **render** a page should be optimized in the same way as the HTML page itself.

Problems with files can result in the page not rendering correctly. This can have a negative impact on the user experience. It can also negatively affect **page speed**, which is an important Google ranking factor.

Overview of what the error messages ("Problem" column) mean and how to fix them:

- **Missing content-type specification:** Your server is not providing **content-type** information when transferring the file, which can lead to rendering problems in the browser. Make sure that there is a content-type specified in the **HTTP header** for each file.
- **Different file extension:** The file extension does not match the content-type that is specified. Make sure that the two specifications are in line in order to avoid any display problems. For example, a CSS file with content-type "text/css" should end with ".css".
- **Missing compression:** Files are not sent compressed from the server, which can make loading slow. Use compression, like **gzip** for text files.
- **High load time:** The file takes longer than 1 second to load. Check out [our blog to find out](#) how to improve your loading speed.
- **Redirect:** The source URL of the linked file redirects to a different URL. Avoid unnecessary redirects by linking all files directly to the target file.
- **Large file size:** The file size is very large. Make sure that your images are no larger than 2 MB and that your CSS and JavaScript files are no larger than 0.5 MB.

#	URL	Statuscode	Content type	Loading time	File Size	Issue
1.	https://framerusercontent.com/images/McAK0vcX0hCZTHrJgRtZ...	200	image/jpeg	0.305 s	25.0 kB	Unmatched extension

Non HTTPS content on HTTPS pages

Pages that are encrypted for transport via https, but contain insecure content such as images, etc.

No errors or problems were found.

Too many files within a page

Pages with too many included files

No errors or problems were found.

Medium response time

Pages that have a medium response time

Optimization Tips

The URLs in this list had an average server response time (between 0.5 and 1 second) when your website was crawled by Seobility.

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "[page speed](#)") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

Learn more about how to optimize server response time and page loading time:

- [Page Speed: What it is and how to improve it - Seobility Wiki](#)
- [39 Page Speed Optimization Tips - Seobility Blog](#)

#	URL	Response time in seconds	Difference to the average response time
1.	https://perfoumer.az/catalog?brand=Escentric Molecules	0.50014	106%
2.	https://perfoumer.az/notes/mystikal	0.50133	107%

Slow response time

Pages that are slower than the average or even exceed the acceptable response time limit. Only the HTML page response time is checked.

Optimization Tips

The URLs in this list had a slow server response time when your website was crawled by Seobility (compared to the average response time of your pages).

Why you should ensure a fast response time:

A server's response time contributes to the overall load time (also called "page speed") of a website which is an officially confirmed Google ranking factor. The faster a page can be loaded, the faster and more efficiently Googlebot can [crawl the page](#). In addition, fast-loading pages provide a good user experience, whereas slow pages tend to frustrate users.

Note: This analysis only measures the time it takes for the server to respond to the client's request and start transmitting the HTML page. However, the total load time of a web page will include additional steps (e.g. loading of CSS, JavaScript, images, etc.) and will therefore be longer. You can use Google's [PageSpeed Insights](#) if you want to measure the total load time of a page.

The server location used to measure response time is **Germany**.

What to do in case of long response times:

One of the most frequent solutions for long response times is to check if [caching](#) and preloading are enabled on your server. Caching ensures that the server always has the content of your pages "at hand". This allows the server to respond more quickly to requests.

Please note: If you experience long response times in one crawl, and then see a significant improvement in a second crawl (without having changed anything), this is usually due to the server cache being filled in the first crawl and then being ready for the second crawl. Therefore, make sure that your server cache is already filled **before** you crawl your website with Seobility to avoid such fluctuations in the results of this analysis.

Internal link anchor texts that need improvement

Link anchors that can be improved

Optimization Tips

Video tutorial included ►

Here you will find pages that are internally linked with [link texts](#) that need improvement.

Why link text is important for SEO:

A link's anchor text is a very important element from an SEO perspective, as it tells search engines what the linked page is about. Ideally, it should contain the [keyword](#) for which the linked page (target page) is intended to rank. Link texts offer great potential for optimization, especially for internal links. This is because the frequent use of [exact-match" keyword link texts](#) is usually not penalized (unlike the use of such link texts for [backlinks](#)).

What the notes in the "Problems" column mean:

- **Link text to page is empty:** There are internal links pointing to the page with an empty link text.
- **Link anchor text is trivial:** The link text that is used to link to the page says nothing about the content of the page. (Typical examples are link text such as "here", "read more" or "read the article").
- **Link anchor text too long:** The text linking to the page is over 120 characters and should be shortened.
- **The link contains an image but has no alt-attribute:** The link to the page is not a regular text link, but is an image link. For such image links, search engines use the [ALT attribute](#) instead of the link text to learn about the linked page. However, when this error occurs, the image has no ALT attribute.

By clicking "Details", you can find out which page contains the link text that needs improvement.

How to optimize your link texts:

- The link text should provide a short, but still meaningful, description of the content of the page being linked to.
- Ideally, the link text should contain the keyword for which you want the linked page to be ranked.
- You should always provide a link text for a text link and an ALT attribute for an image link.

You can find more detailed instructions on how to optimize your internal links, including the link text, in our [internal linking guide](#).

#	Linked page	Problems
1.	https://perfoumer.az/brands	Link text to page is empty

Identical anchor text for different pages

Link anchors that are used for different pages

Optimization Tips

Video tutorial included ►

The anchor texts in this list are used for several different link targets on your website.

Why you should not use identical anchor texts for different pages (link targets):

The purpose of [anchor texts](#) is to tell visitors and search engines what the linked page is all about. Therefore, they should be informative and include [keywords](#) that are relevant to the linked page.

If the same anchor texts are used for different link targets, there will be an overlap, as this signals to search engines that several pages are about the same topic. This can lead to "[keyword cannibalization](#)". You are also missing out on the opportunity to optimize the pages for more specific keywords by using unique anchor texts.

In general, you should also avoid trivial anchor texts such as "show more" or "read more", as these also don't make use of the optimization opportunities that anchor texts offer.

You can find more information about optimizing anchor texts [in our wiki](#).

How to fix the problems in this list:

In the column "URLs linked with this anchor text", you will find all URLs that are linked with a specific (identical) anchor text. Think about which unique anchor texts you could use instead to link to these pages.

Click on "Details" to find out on which pages the identical anchor text is used and change it accordingly.

#	Anchor text	URLs linked with this anchor text
1.	məhsula keç	https://perfoumer.az/perfumes/amber-wood https://perfoumer.az/perfumes/colonia-futura

Pages with a lot of internal links

Pages with an above-average number of internal links

Optimization Tips

The pages in this list contain a large number of [internal links](#). This includes:

- Pages that have a significantly higher number of internal links than the average number of internal links per page.
- Pages that contain more than 400 internal links

Why you should avoid pages with too many internal links:

Internal links are very important for SEO because they allow search engines and users to navigate from page to page on your website. Search engines can also use internal links to determine which of your sub-pages are the most important.

Your internal linking structure should be as natural and user-friendly as possible. You should avoid pages with an excessive number of internal links, as these can quickly become overwhelming. In addition, the more internal links you have, the greater the risk that search engines will not follow all the links on the page when crawling.

How to fix these problems:

Take a close look at the pages below. See if you can reduce the number of internal links they contain. Alternatively, it may make sense to split the content of the pages into several sub-pages if the content is very large.

If one of the pages is an [HTML sitemap](#), you may want to add the robots attribute "[noindex](#)".

For a detailed guide to optimizing the internal linking of your site, [click here](#).

#	URL	Number of links
1.	https://perfoumer.az/	267
2.	https://perfoumer.az/brands	266

Problems with external Links

Problems with external links that are broken or redirect to another page

Optimization Tips

Video tutorial included ►

This analysis provides an overview of problematic [external links](#) on your website.

Why you should fix problems with external links:

Linking to external sites is usually a good idea, as it adds value to your content by providing related resources for your visitors. This is also a sign of quality for search engines. After all, there are no

scientific studies or articles without references.

However, external links that point to inaccessible or redirecting pages with different content than expected can lead to a poor user experience. Therefore, you should remove them as soon as possible. Unfortunately, it is not possible to prevent problems with external links in advance, as you usually do not have any control over the content of the linked pages. However, as soon as you see any new problems here, you should check the links and update them if necessary.

You can find more best practices for external links [in our wiki](#).

What the notes in the "Problems" column mean:

- **Bad HTTP status code:** The server of the page you are linking to returns an error code when the URL is requested. You can find an overview of the meaning of the various HTTP status codes [here](#).
- **Page is down:** The server of the linked page did not respond at the time the URL was requested. Possible causes: server problems, the Seobility bot is blocked from accessing the page.
- **Redirect:** The linked page redirects to a different URL.
- **Parked domain:** The linked website is no longer online and the domain has been put up for sale.
- **Domain not connected:** The domain you are linking to is not connected to a web server and is therefore not serving any content.

How to fix these problems:

First, do a manual check of the links in this list in your browser. In this way, you can rule out that the problem was temporary or that only the Seobility bot was blocked from accessing the page.

If the link does not lead to the desired content when manually checking, you should remove or replace the link. The list shows on which pages of your site the external link is included.

Note: The results of this analysis are cached in Seobility for a few days in order to minimize access to other websites. Consequently, you may see some errors here that no longer exist.

Pages with a big distance to the homepage

Pages that can only be reached with more than 3 clicks from the homepage

Optimization Tips

Video tutorial included ►

The pages in this list have a large distance to the homepage of your website, i.e. it takes many clicks to get to these pages from the homepage.

Why you should link your pages as close to the homepage as possible:

Important sub-pages should be accessible with just a few clicks from the homepage, to ensure that Google is able to find and [index](#) this content. Conversely, pages buried deep within your site structure may go unnoticed by visitors or search engine bots. Furthermore, deeply linked pages are considered less relevant by Google. So make sure that important pages are not linked too deeply within your site structure.

What the information in this list means:

The "Page level" column shows you for each URL, how many clicks it takes to reach that page from your homepage. By clicking on "Details", you can see the click path (all the URLs that need to be visited to get there). If there is more than one possible click path, the one that is shortest from the homepage will be displayed here.

How to fix these problems:

For each URL, check whether it would be possible and useful to link to it at a higher level. You can do this by analyzing the click path and inbound links (both of which can be found under 'Details').

You can find more tips on how to optimize your internal links [on our blog](#).

Pages with only a few internal links

Pages with a below-average number of internal links

No errors or problems were found.

Redirects

Internal redirects that have been linked

No errors or problems were found.

Problems with redirects

Redirects that refer to a broken page (404, server error etc.).

No errors or problems were found.

Redirect loops

Redirect loops because of HTTP redirects and canonical links

No errors or problems were found.

Canonical link errors

Canonical links that refer to broken links

No errors or problems were found.

Alternate link errors

Problems with alternate links (links to specify alternative language or country versions of a page)

No errors or problems were found.

Pages with only a few paragraphs

Pages with little text or few paragraphs

Optimization Tips

The pages in this list contain less than three paragraphs of text.

Why you should break up your content into clear paragraphs:

To make text easier to read and understand, it is very helpful to break it up into paragraphs. This makes it easier for visitors to understand your content. It also increases the likelihood that they will spend more time on your pages.

What does Seobility define as a "text block"?

A "text block" is a coherent text section that contains at least 100 characters and is enclosed by HTML structural elements such as <p> or <div>. Headings or lists are not counted as text blocks.

How to solve these problems:

In addition to the number of paragraphs that were found, the "Number of words" column will show you how long the content of the page is in total. If the word count is high, you should structure the text in a better way. Use headings, teasers, paragraphs and subheadings to break up the text.

On the other hand, if there is little text content on the page, there may be room to expand the content.

Note: For pages with image galleries, result lists, and similar content that does not require long/structured text, you can ignore the warnings.

More information on this:

Pages with little text

Pages that contain only very little text

Optimization Tips

The pages in this list contain less than 500 words.

Why pages with little text can be problematic:

A text that is too short is problematic if the subject or the keyword of the page requires detailed and extensive information. If your competitors are offering better and more comprehensive content on the same topic, you're going to struggle to rank with short content.

However, it is not necessarily a problem to have pages with little text. If the pages are e.g. image galleries, landing pages, etc., it is perfectly fine to use very little text.

In addition, there are times when search engine users are in need of a quick and concise answer to a particular search query, and a long and lengthy text page is not the answer. In this case, long and detailed text may deter visitors.

How you should treat these pages:

Before you make any changes to the content of a page, you should first check whether the topic or target keyword of the page requires extensive content or not. You can do this by analyzing the current top 10 search results. With the [free TF*IDF tool provided by Seobility](#), you can easily check the number of words on these pages.

If you find that the content of your page is in fact too short, you can try to expand it. Think about what kind of information your target audience needs in order to fulfil their [search intent](#). However, you'll want to avoid writing long texts that are just designed to boost SEO. Most importantly, your content should add value to your visitors.

You can find more information on how to create high quality and useful content here:

Pages using keywords in page title but not in its body text

Pages with keywords in the title tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the page title do not appear in the actual content of the page.

Why titles and content should be consistent:

The [page title](#) is one of the most important on-page SEO elements and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in the title, with the most important keyword at the very beginning. To ensure consistency between title and content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's page title. The words in the title that do not appear in the content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the page title matches the actual content of the page, and vice versa.

If the title contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the title is not, then you should optimize the title and include important keywords for the page there.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

Pages using keywords in H1 heading but not in its body text

Pages with keywords in the H1 tag, which don't appear in the page's body text

Optimization Tips

This list includes pages where keywords from the H1 heading do not appear in the text content of the page.

Why H1 headings and content should be consistent:

The [H1 heading](#) is an important on-page SEO element and should be a concise summary of the content of the page. Important [keywords](#) for the page should be included in this heading. To ensure consistency between the H1 heading and the content, these keywords should also be included in the content of the page.

What the information in this list means:

The URLs affected by this problem are shown in the left column. The right column displays each URL's H1 heading. The words in the heading that do not appear in the text content of the page are highlighted in bold.

How to fix these problems:

For each page listed, check that the H1 heading matches the text content of the page, and vice versa.

If the H1 contains the most important keywords, then you should also include these keywords in the text of the page. If, on the other hand, the text is properly optimized and the H1 is not, then you should optimize the H1 and include important keywords for the page there.

Ensure that the H1 heading differs from the [page title](#). Both elements should be unique.

One important note:

This analysis does not consider synonyms or declination of keywords. This means that not all of the pages that are listed here need to be problematic. For example, if you have made grammatical adjustments to a keyword in the text of the page to ensure a natural reading flow, then of course there is no need to make any changes. Search engines such as Google have become very good at recognizing such variations of keywords.

Pages with very much text

Pages that contain a lot of text and might be divided into several pages

No errors or problems were found.

Pages with duplicate paragraphs

Paragraphs that are repeated on a page

No errors or problems were found.

Pages with typos

Page content contains typos

No errors or problems were found.

Pages with filler text and images

Pages with filler texts or images

No errors or problems were found.

Pages without text or paragraphs

Pages on which no text or paragraphs were found

Optimization Tips

The Seobility bot did not find any text content on the following pages.

What does Seobility define as "text content"?

A "text block" is a coherent text section that contains at least 100 characters and is enclosed by HTML structural elements such as `<p>` or `<div>`. Headings or lists are not counted as text blocks.

Why you should avoid pages without text:

High-quality content is essential to get ranked on Google. On the other hand, if there is no text content on a page, search engine bots will have very little information to analyze the page's content and [index](#) the page.

How to fix these problems:

If the pages are [sitemaps](#) or pages you are not trying to rank, you should tell robots [not to index](#) these pages. It may also make sense to exclude them from crawling in your [robots.txt](#) if they do not contain important internal links.

However, if the pages contain content that the Seobility bot simply does not recognize, you should make sure that it is accessible to search engine bots. For example, most search engines cannot evaluate text in images or Flash elements.

You can find more information about quality content in our wiki article ["Content is King"](#).

Competing pages for the same keywords

Competing pages due to the same keyword optimization

Optimization Tips

This analysis indicates if there are pages on your website that are optimized for the same keywords and that compete with each other in terms of rankings.

Why you should not have multiple pages optimized for the same keyword:

Search engines such as Google will usually only return one result per website/domain for any given search query. If you have multiple pages optimized for the same keyword, then these pages will be in competition with each other and hinder each other's rankings. This is known as "[keyword cannibalization](#)".

How Seobility identifies competing pages:

Seobility analyzes the content of each of your pages and determines the most important keywords and keyword combinations for each page. If two pages are well-optimized for the same keywords or if there is a large overlap between the optimized keywords, they will be listed here.

How to fix these problems:

If you have more than one page on the same topic on your website, this is a classic case of keyword cannibalization. There are a number of possible solutions that can solve this problem:

- Merge the content of the pages into a single page.
- Add some unique content to both pages to make them stand out from each other and to optimize them for more specific keywords.
- Redirect one of the URLs to the other URL.

Which of these approaches is the best one will depend on the individual case.

Note: This analysis may also display cases of [duplicate content](#) if the pages were not classified as duplicates due to small differences in the text. In this case, the recommendations for duplicate content apply. (See the "Duplicate content" analysis.)

In addition, it is also possible that pages are listed which contain only a small amount of content and have the same page titles or headings. In this case, we're not talking about "keyword cannibalization" but about "[thin content](#)". If you have pages like this, you should check whether you really need them and add more content to them if necessary.
